Installing a Nissan A15 engine Phil has installed a late 1980's A15 into his 1972 Datsun 1200. His Datsun 1200 is an auto (his girlfriend drives it everyday, doing deliveries), and since she "smokes clutches like cheap cigarettes," he decided to stick with the auto box.

~~Datsun 1200 Modifications :: Engine Info~~

The engine is based on the Nissan VG engine and was only used for the Nissan Maxima J30 (1992-1994 model years). It produces 190 HP (142 kW, 193 PS) at 5,600 rpm, the torque is 260 N·m (26.5 kg·m, 191.7 lb·ft) at 4,000 rpm.

~~List of Nissan engines: Gasoline (Petrol) and Diesel~~

It did not use the same nomenclature of the later Nissan engines, with all models sharing the same displacement and simply called "E". It displaced 1.2 L (1,189 cc) from a 73 mm × 71 mm (2.87 in × 2.80 in) bore and stroke. Output is 48 PS (35 kW). This E series was produced from 1958 through the late 1960s.

troubleshooting, cooling systems, emission controls, fuel systems, transmissions, turbocharging, diesel engines, clutches, transaxles, differentials, suspension, steering, brakes, and fuel injection.

This is a comprehensive guide to modifying the 1991 – 2006 Nissan Sentra, NX, and 200sx and Infiniti G20 for street and racing performance. It includes sections on models and engines, engine theory, bolt-on performance components, cylinder heads and bottom end modifications, forced induction, engine swaps, brakes, suspension, wheels and tires, cosmetic and aerodynamics, and safety.

How to maintain your import car.

A research bulletin examining the Japanese automotive industry's impact worldwide.

Technologies and Approaches to Reducing the Fuel Consumption of Medium- and Heavy-Duty Vehicles evaluates various technologies and methods that could improve the fuel economy of medium- and heavy-duty vehicles, such as tractor-trailers, transit buses, and work trucks. The book also recommends approaches that federal agencies could use to regulate these vehicles' fuel consumption. Currently there are no fuel consumption standards for such vehicles, which account for about 26 percent of the transportation fuel used in the U.S. The miles-per-gallon measure used to regulate the fuel economy of passenger cars is not appropriate for medium- and heavy-duty vehicles, which are designed above all to carry loads efficiently. Instead, any regulation of medium- and heavy-duty vehicles should use a metric that reflects the efficiency with which a vehicle moves goods or passengers, such as gallons per ton-mile, a unit that reflects the amount of fuel a vehicle would use to carry a ton of goods one mile. This is called load-specific fuel consumption (LSFC). The book estimates the improvements that various technologies could achieve over the next decade in seven vehicle types. For example, using advanced diesel engines in tractor-trailers could lower their fuel consumption by up to 20 percent by 2020, and improved aerodynamics could yield an 11 percent reduction. Hybrid powertrains could lower the fuel consumption of vehicles that stop frequently, such as garbage trucks and transit buses, by as much as 35 percent in the same time frame.

The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United

States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.
