But his book goes beyond a simple comparison of improvement tools to show how these tools can be implemented and supported. Instead, it offers a broader strategic explanation of how they relate to one another, and their relative strengths and weaknesses in the larger context of the entire enterprise. It demonstrates how to use these tools in an integrated way such that they are not just be viewed as another "program of the month or management fad. Selecting the Right Manufacturing Improvement Tools guides the use of these individual management tools within the need for aligning the organization, developing leadership, and managing change, all for creating an environment where these tools will be more successfully applied. Today, educators often find themselves facing a dizzying array of materials and resources, whether they are a box of dusty skills cards handed down from a retiring teacher, a professional book passed on by a colleague, a procedure recommended by a supervisor, a program required by a district, a book reviewed on a blog, a unit downloaded from a website, or a strategy highlighted in a brochure. But how do we know which of these will help the children in our classrooms? How do we find helpful resources without squandering funding or instructional time-not to mention our students' potential? In The Right Tools, Towanda Harris lays out a path that teachers and administrators can use to make informed decisions about what resources and practices they need for the students they teach. Rather than telling you what to buy or use, Towanda offers tools and guidance to help you to make that decision as you identify what you and your students need match resources with your goals for your students use the resource with a focus on your students assess how well the resource is working adjust how you are using the resource as necessary utilize one of the most powerful resources available to you as a teacher-your colleagues. Resources are only a piece of your teaching, alongside knowledge of best practices, and a deep understanding of your students. Yet each of these pieces can have powerful effects. By finding and using resources that are well matched to your students and their academic goals, you can keep working to help students reach their full potential.

This book describes several of the more common and popular methods, including case studies, being used by manufacturing companies to improve their business. Even before we cover these tools and strategies, we cover several fundamental issues-if present, almost any tool will be effective, but if absent, almost not tool will work, i.e., the need for leadership and several models thereto for creating an environment that brings out the best in people, the need for innovation throughout the organization, including what I call "big innovation" - R&D and new product/process development, but also "little innovation"- using the proper tools in a disciplined way to lower our costs and improve quality so that we have higher margins to pay for the big innovation. We will also cover the use of cross-functional teams in applying these methods, and a process for managing change, as well as a model for measuring performance and demonstrating that operational and business goals have been achieved. Finally, we will review a process that I call business level failure modes and effects analysis (FMEA) for identifying the right projects for improvement, and for selecting the right tools for that projects.
